Q: Does National Barn Company build custom buildings?

A: Yes. We can customize your building to fit your needs within certain boundaries. We can build wall heights of 10', 12', 14', 16' and 18'. We can build any width up to 60' and any length imaginable. You can select the options that you want and determine the location for all door and windows, keeping in mind that we will provide advice in order to maintain the building's structural integrity.

Q: How should I ventilate my building?

A: We offer multiple options to ventilate your barn, including ridge vents, gable vents, cupolas, closure vents, and exhaust fans. Any of these products will offer sufficient ventilation and can be used in combination with each other.

Q: What is the difference in wall height and ceiling clearance?

A: The post-frame industry uses outside wall height as the standard for measuring size. A 10' wall height (or eave height) will have approximately 9'4" of clearance inside your building due to header plates and ceiling joists. Concrete flooring further reduces inside clearance. For this reason, we build our sliding doors 1' shorter than the specified wall height and overhead door frame outs 2' shorter than the specified wall height. This allows anything that fits through the doors to clear the ceiling joists.

Q: What is the cost of building a barn?

A: The cost of building a barn can vary depending on a number of factors, including size, style, features, and finishes. Visit our [website](#) and request a customized quick quote based on your specific needs.

If you have any further **questions** or **need assistance**, please don't hesitate to reach out.
